Simulate Differential Expression (DE)

Hi,

I try to setup a Iontorrent RNA-seq simulation experiment. Following the help and our owns protocols I success creating one experiment with Flux simulator. Things is I want to setup a differential expression simulation. I want two experiments and a file summarising the difference between both experiments (for example RPKM). I cannot find a way to simulate this. Could I make it works with Flux-simulator?

Many thanks

Regards
