

Geuvadis Quantifications

Flux Version

[Flux Capacitor 1.0.1](#)

Read Mappings

Unfiltered GEM read mappings were employed, after converting them to BED format.

Annotation File

The quantifications are based on the Gencode (v12) reference annotation:

[gencode.v12.annotation.gtf.gz](#)

Parameter File

```
ANNOTATION_FILE gencode.v12.annotation.gtf
READ_DESCRIPTOR {ID}/{MATE}[1,2]
ANNOTATION_MAPPING PAIRED
```

Command Line

```
flux-capacitor -p <parameter_file> -i <sample.bam> -o <output.gtf>
```

Pipeline

To speed up computation of the big dataset, the [JIP pipeline system](#) has been employed. All datasets were quantified in parallel, splitting each dataset on a per-chromosome base.
